

\$ARCIRCLE

Two launchpads. One core coin.

ArcPad, CirclePad and the coin at the centre of them — on Circle's Arc

BEFORE YOU READ

Important notice

This document describes how ARCIRCLE PAD and the \$ARCIRCLE coin work today, and what the project intends to build next. It is an explanation, not an offer.

Not financial advice

\$ARCIRCLE is a community memecoin on Circle's Arc network. Nothing in this whitepaper is financial, investment, legal or tax advice, and nothing in it is a promise of profit, price, return or listing. Crypto assets are volatile and can lose all of their value. Only use what you can afford to lose, and do your own research.

How to read this document

- **Live** **LIVE** means the feature is deployed on Arc mainnet and anyone can use or verify it on-chain today.
- **In progress** **SOON** means part of it exists (for example a deployed contract that hasn't been started) and the rest is being built.
- **Planned** **PLANNED** means an intention. Plans can change, slip or be dropped as the project learns what works.

Every number marked "*at the time of writing*" was read directly from Arc mainnet on 23 September 2026 and will have moved since. Where this document and the chain disagree, **the chain is right** — every contract referenced here is listed with its address in Section 9 so it can be checked independently on ArcScan.

Forward-looking statements

Sections on the flywheel, rewards, CirclePad v2 and the roadmap describe future work. They reflect current intent, not commitments. Revenue splits, reward formulas and timelines will be published on the website before anything goes live, and may differ from what is sketched here.

Impostors

The only official \$ARCIRCLE contract is 0xe5718F298ac3b65FAf7c711b56cBD72b3bb15fF7, launched on Argus on 25 September 2026. It is published on arcircle.app and by @ARCIRCLEonArc. Other tokens with similar names already exist on Arc — including one called "ARCcircle" with its own pair on Dexscreener. ARCIRCLE PAD will never identify \$ARCIRCLE by name or ticker alone; always check the contract address.

Relaunch notice

\$ARCIRCLE was relaunched on Argus (argus.world) on 25 September 2026 and now trades in a Uniswap v4 pool paired with USDC, with its whole supply in one liquidity position locked by Argus. New contract: 0xe5718F298ac3b65FAf7c711b56cBD72b3bb15fF7. The first launch (foci, 22 September 2026) is retired. Sections that describe the foci bonding curve and graduation cover that first launch only; the rest of the paper applies to the relaunched coin.

ABSTRACT

One ecosystem, pointed at one coin

ARCIRCLE PAD is a launch ecosystem on Circle's Arc network, the chain where USDC is the native currency. It offers two different ways to bring a new coin to market — and one coin, \$ARCIRCLE, that the whole ecosystem is designed to feed.

ArcPad is for instant, permissionless launches. Anyone can create a coin in a single transaction for a flat 1 USDC fee. The coin's sellable supply goes straight into a real Uniswap v4 pool from its first block, so there is no bonding curve to "graduate" from and no migration to wait for. Every coin opens at the same fair starting point — about \$4,350 of market value — whether it is paired with USDC, with \$ARCIRCLE, or with any other token on Arc.

CirclePad is for launching together. Instead of one creator and a crowd of snipers, a project raises USDC from its community over a fixed 72-hour window. Contributors can withdraw at any time while the window is open. In its full design, the biggest backer becomes the project's lead, every contributor votes on what the project becomes, and the lead's payout vests slowly and can be clawed back if they walk away.

\$ARCIRCLE is the coin between them. It was relaunched on Argus on 25 September 2026 and trades in a Uniswap v4 pool paired with USDC, with its whole supply in one locked liquidity position and no team allocation. The ecosystem is designed so that what ArcPad and CirclePad earn, together with the creator's 90% of \$ARCIRCLE's trading tax, flows back into \$ARCIRCLE through buybacks, liquidity support and — once built — rewards for holders and creators.

1 USDC

to launch a coin on ArcPad

≈ \$4,350

starting market cap for every
ArcPad launch

72 h

per CirclePad raise, withdrawable
while open

This paper explains each piece in turn: how ArcPad prices and trades coins (Section 4), how CirclePad rounds work today and where they are going (Section 5), how \$ARCIRCLE itself works and what it is for (Section 6), how revenue is meant to turn the flywheel (Sections 7–8), how the system is built and secured (Sections 9–10), and the roadmap ahead (Section 12).

The design goal in one line: **every launch on ARCIRCLE PAD should make \$ARCIRCLE a little stronger — and a stronger \$ARCIRCLE should bring in the next wave of creators.**

AT A GLANCE

\$ARCIRCLE in numbers

Name / ticker	arcircle / \$ARCIRCLE
Contract (CA)	0xe5718F298ac3b65FAf7c711b56cBD72b3bb15fF7
Network	Arc mainnet (chain ID 5042) — gas is paid in USDC
Standard / decimals	ERC-20 · 18 decimals
Total supply	1,000,000,000 \$ARCIRCLE — fixed
Burned	116,772,290.56 \$ARCIRCLE (11.68% of supply), sent to the dead address 0x...dEa0 on 25 September 2026 — tx 0x0c90...99ae. Circulating: 883,227,709
Launched	25 September 2026, 14:09 UTC, on Argus (argus.world) — relaunch; the first launch on foci.family (22 September 2026) is retired
Where it trades	Argus · Uniswap v4 pool paired with USDC (pool fee 1%, tick spacing 200), liquidity locked by Argus
Initial distribution	All 1,000,000,000 minted by Argus straight into one Uniswap v4 liquidity position above the opening price — no team or insider allocation
Trading costs	1% pool fee + the launch's buy / sell tax (1–10% per side, fixed forever at launch), charged on the USDC leg. Argus keeps 10% of the tax; 90% goes to the creator's allocation. Wallet-to-wallet transfers pay nothing.
Graduation	None needed — \$ARCIRCLE has traded in its Uniswap v4 pool from the first block
Role	Core coin of ARCIRCLE PAD · selectable pair token for ArcPad launches · target of the revenue flywheel

The ecosystem

ArcPad LIVE

- Instant launch, 1 USDC flat fee
- Real Uniswap v4 pool from block one
- Fixed supply 1B; 92% into the pool, 8% platform allocation
- 1% base trade fee (70% to the creator) + optional 0–2% creator add-on
- Pair with USDC, \$ARCIRCLE or any Arc token

CirclePad SOON

- One project at a time, 72-hour USDC raise
- Contributions withdrawable until the raise closes
- First-round escrow deployed on Arc mainnet
- Lead selection, voting and vesting planned for v2
- Platform share feeds the same flywheel

Market figures (price, market cap, holders) change every block. The live numbers are always on the \$ARCIRCLE page at arcircle.app/arc#arcircle, read straight from the chain.

SECTION 1

1 Why Arc

Arc is Circle's own layer-1 blockchain. Its defining choice is simple and unusual: the native currency — the thing you pay gas in — is USDC, not a volatile token.

On most chains, launching or trading a small coin means holding two volatile assets: the coin itself, and the chain's gas token. A new user has to buy ETH, SOL or BNB first, keep some aside for fees, and watch both move. On Arc, the dollar is the base layer. A wallet funded with USDC can pay for gas, pay a launch fee and buy a coin with the same balance.

What this means for a launchpad

Prices people understand

Coins on ArcPad are priced against USDC by default, so "\$0.0000043 per token" and "\$4,350 market cap" mean exactly what they say — no conversion through a gas token.

Predictable costs

Gas is priced in USDC. A standard ArcPad launch uses about one million gas — around two cents at the time of writing — and a launch never costs more than the 1 USDC fee plus that gas.

One balance, one approval

Arc exposes USDC both as the native currency and as an ERC-20 at 0x3600...0000. They are the same money, so the launch fee can be paid as native value while trades use the ERC-20 interface.

A familiar toolchain

Arc is EVM-compatible. Uniswap v4's PoolManager is deployed there, standard wallets connect over WalletConnect, and the canonical Multicall3 contract is available for efficient reads.

Why build early

New chains are won by the projects that make them useful first. Arc gives creators stable-value accounting and low, predictable fees, but a new network also starts with little tooling for ordinary users who just want to launch or buy a coin. ARCIRCLE PAD sets out to be that tooling: a place where a coin can go from idea to live, tradable Uniswap pool in one transaction, and where community raises can happen with rules enforced by contracts instead of promises.

Arc makes the dollar the unit of account. ARCIRCLE PAD makes that dollar easy to launch with.

Arc network details in this paper (chain ID 5042, USDC gas, the USDC predeploy address and the Uniswap v4 PoolManager address) are taken from the live configuration the ARCIRCLE PAD site runs against.

SECTION 2|

2 The problem with launchpads

Memecoin launchpads made it trivial to create a token. They did not make it fair to launch one, safe to buy one, or rewarding to build a community around one.

Four recurring failures

1 · Snipers win the first block

Launches that start on an empty bonding curve reward whoever gets in first. Bots buy in the same block as the launch and sell into the first real buyers. The community arrives to a chart that has already been harvested.

2 · The graduation cliff

Curve-based launchpads trade on a private curve until a threshold is hit, then migrate liquidity to a DEX. Price discovery happens twice, liquidity moves mid-life, and many coins die just below the line.

3 · Rugs and walkaways

When a creator or a "raise lead" receives funds up front with no conditions, the cheapest strategy is often to take the money and leave. Contributors have no recourse, and every rug makes the next launch harder.

4 · Value that goes nowhere

Launchpads earn fees on every launch and trade, but that value rarely comes back to the community that created the activity. There is no shared asset that gets stronger as the platform grows.

What ARCIRCLE PAD changes

PROBLEM	ARCIRCLE PAD'S ANSWER
Sniping an empty curve	ArcPad coins open at a fixed, non-trivial valuation ($\approx$ \$4,350) in a real pool; CirclePad pools real USDC before trading starts, so the first price is set by the community, not a bot.
Graduation cliff	ArcPad has no curve to graduate from: the Uniswap v4 pool <i>is</i> the market from block one.
Rugs and walkaways	Contracts, not people, hold the money. CirclePad refunds are always open during a raise, and v2 vests the lead's share with an automatic clawback.
Value that goes nowhere	Launch fees, platform allocations, trading fees and raise shares are designed to flow into one coin — \$ARCIRCLE.

None of this removes risk. Memecoins remain speculative, and a fair launch can still go to zero. The goal is narrower and achievable: make the rules visible, enforce them on-chain, and make sure the ecosystem's growth has somewhere to go.

SECTION 3|

3 Two launchpads, one coin

The name says it: Arc for ArcPad, Circle for CirclePad — two ways to launch, joined into one circle by \$ARCIRCLE.

Figure 1 — Both launchpads route part of what they earn toward the same core coin.

Design principles

- 1. Contracts hold the money.** Launch fees, pools, raises and refunds live in contracts on Arc. The website is only an interface to them.
- 2. Fair first price.** No launch should start at a price a bot can take for free.
- 3. Real liquidity early.** ArcPad coins trade in a Uniswap v4 pool from their first block; CirclePad is designed to turn most of a raise into pool liquidity at launch.
- 4. Everything is readable.** Every price, trade, holder list and chart on the site is computed from on-chain data in the visitor's own browser. There is no private database to trust.
- 5. One direction for value.** Revenue has one destination: \$ARCIRCLE and the people who hold and build with it.

SECTION 4 **LIVE**

4 ArcPad — instant launches

ArcPad turns a name, a ticker and an optional logo into a live, tradable coin in one transaction. There is no waiting list, no curve and no migration: the market exists from the moment the transaction confirms.

What happens in the launch transaction

Optional in the same transaction: a dev buy, so the creator buys first at the opening price.

Figure 2 — A launch is a single atomic transaction: either every step happens, or none do.

The launch form

- **Name and symbol** — required. Every coin has exactly 1,000,000,000 supply; there is no mint function afterwards.
- **Logo, description, website and socials** — optional, stored on-chain with the launch record so any interface can display them. Uploaded logos are shrunk automatically to a small icon, because every byte stored costs gas.
- **Pair token** — USDC by default, or \$ARCIRCLE, or any Arc token with a known price (Section 4.4).
- **Creator fee add-on** — 0% to 2% on top of the base fee, 100% paid to the creator (Section 4.3).
- **Dev buy** — an optional first buy executed inside the launch transaction, before anyone else can trade.

Before anything is sent to the wallet, the site checks that the wallet can afford the launch (fee + gas + dev buy) and dry-runs the transaction, so a launch that would fail shows a plain reason instead of a cryptic error. After it confirms, the site opens the new coin's page automatically.

SECTION 4.2

Pricing and the fixed starting point

An ArcPad pool is a standard Uniswap v4 pool holding one single-sided liquidity position. Inside that position, it behaves exactly like the classic constant-product market $x \cdot y = k$.

A virtual reserve instead of a curve

At launch the pool holds only the new coin — the 920,000,000 sellable tokens — and no pair token at all. The position starts at a price chosen so that the pool behaves as if it also held a **virtual reserve** worth \$4,000 of the pair token. The virtual reserve never exists as real money and cannot be withdrawn; it simply sets where the price curve begins.

S = 920,000,000 sellable tokens in the pool
 V = virtual reserve worth \$4,000 of the pair token
 $P_0 = V / S \approx \$0.00000435$ per token
 Market cap at open = $P_0 \times 1,000,000,000 \approx \$4,350$

As buyers add real pair tokens to the pool and take coins out, the product of the two sides stays constant. After buyers have added a total of q (in dollar terms), the price is:

$P(q) = (V + q)^2 / (V \cdot S)$ → price grows with the square of what's been put in
 Tokens received for a buy of $q = S - V \cdot S / (V + q)$

Figure 3 — Market cap versus net USD bought in (before fees), for any ArcPad launch. Same curve for every coin.

Worked examples (fees ignored)

FIRST BUY	TOKENS RECEIVED	SHARE OF POOL	PRICE AFTER
\$10	≈ 2.29 M	0.25%	+0.50%
\$100	≈ 22.4 M	2.4%	+5.1%
\$1,000	≈ 184 M	20%	+56%
\$4,000	460 M	50%	×4

The pool is initialised on the nearest usable tick (spacing 200, about 2% per step), so a coin's real opening price can sit up to ~2% away from the ideal P_0 . The coin page always shows the exact on-chain price.

SECTION 4.3

Fees and allocations

ArcPad earns in three ways, all enforced by the factory and the pool's fee hook: a flat launch fee, a fixed token allocation, and a share of every trade.

ITEM	AMOUNT	WHERE IT GOES
Launch fee	1 USDC, flat	Paid as native value with the launch transaction and forwarded to the platform treasury. Anything sent above 1 USDC is refunded in the same transaction.
Platform allocation	8% of supply (80,000,000 tokens)	Sent to the platform treasury at launch. The remaining 92% goes into the pool as sellable supply.
Base trade fee	1% of each swap's output	Split by the hook on every trade: 70% to the coin's creator , 30% to the platform.
Creator add-on	0% – 2%, set at launch	Optional extra fee chosen by the creator, 100% to the creator . Capped at 2% by the factory.

How the trade fee is taken

ArcPad pools have no Uniswap LP fee (the pool's own fee is set to zero). Instead, the **HomepadHybridHook** runs after every swap and takes its fee from the swap's *output*: in the coin when someone buys, in the pair token when someone sells. It then pays the creator and the platform immediately, in the same transaction. Nothing accrues in a contract waiting to be claimed.

1–3%

total fee per trade, depending on the creator's add-on

0.7–2.7%

of each trade paid straight to the creator

0.3%

of each trade to the platform, whatever the add-on

Worked example

A coin launched with a 1% creator add-on (2% total). Someone sells tokens for 500 USDC of pool output:

Total fee	$2\% \times 500 = 10.00$ USDC	→ seller receives 490.00 USDC
Base 1%	5.00 USDC	→ creator 3.50 · platform 1.50
Add-on 1%	5.00 USDC	→ creator 5.00
Creator earns	8.50 USDC	· Platform earns 1.50 USDC

Why creators are paid per trade

Paying the creator a share of volume, not a lump sum, aligns them with the coin's long-term activity. A creator who keeps building keeps earning; a creator who abandons the coin stops earning with it. The platform's share — together with the launch fee and the 8% allocation — is the revenue that feeds the \$ARCIRCLE flywheel described in Section 7.

Fee parameters (base 1%, 70/30 split, 0–2% add-on, 1 USDC fee, 8% allocation) match the deployed factory and hook, and are shown in the launch form's live fee preview.

SECTION 4.4 LIVE

Pair tokens

Every ArcPad coin is paired with one other token — the token buyers pay with and sellers receive. USDC is the default, but the factory accepts any ERC-20, so a creator can pair with \$ARCIRCLE or with any token on Arc.

USDC DEFAULT

Arc's own currency. Prices, volume and liquidity are in dollars with no conversion. Best for most launches.

\$ARCIRCLE

Every buy of the new coin first needs \$ARCIRCLE, and the pool's liquidity is held in \$ARCIRCLE. A direct link between new launches and the core coin.

Any Arc token

Paste a contract address. Useful for community coins that want their own ecosystem of launches around them.

Same starting point for every pair

To keep launches fair across pairs, the virtual reserve is always sized to **\$4,000 of the pair token** at its current price. If \$ARCIRCLE trades at \$0.0000048, the reserve is about 826 million \$ARCIRCLE; if the pair is USDC, it is exactly 4,000 USDC. Either way the coin opens at $\approx$ \$0.0000043 and $\approx$ \$4,350 market cap.

How the pair token is checked

1. **It must be a real ERC-20 on Arc** — the site confirms there is contract code at the address and that it answers `decimals()`, `totalSupply()` and `balanceOf()`.
2. **It must have a known USD price**, taken from the best available source: USDC itself; the \$ARCIRCLE bonding curve; an ArcPad pool (for coins launched here, priced through their own pair); or Dexscreener. A token with no price can't set a fair starting point, so the launch is refused.
3. **Custom tokens carry a warning**. Tokens that tax transfers, rebase, or can freeze wallets can break a pool and trap funds. The site can't detect every such behaviour, so creators should only pair with tokens they trust.

What changes with a non-USDC pair

- Dev buys, approvals and balance checks use the pair token.
- The coin's USD price moves with both its own market *and* the pair token's price.
- Sell-side fees are paid in the pair token — for a \$ARCIRCLE pair, the creator and the platform earn \$ARCIRCLE.
- Coin pages show amounts in the pair token alongside USD values, and the chart is plotted in USD.

Pairing with \$ARCIRCLE turns every new launch into a reason to hold the core coin — the simplest form of the flywheel.

SECTION 4.5 LIVE

Trading and coin pages

Every ArcPad coin gets its own page — a live chart, trade history, holders, links and a buy/sell box — built entirely from on-chain data in the visitor's browser.

Buying and selling

Trades go through the **HomepadArcSwapRouter**, which settles against the coin's Uniswap v4 pool in a single call. Each trade has a minimum-output floor: if the price moves past the chosen slippage (0.5–5%) before the trade lands, it reverts instead of filling at a worse price.

1. **Quote.** The page reads the pool's live price and liquidity and computes the exact constant-product output, minus the hook's fee.
2. **Approve.** The first trade in each direction asks the wallet to approve exactly the amount being traded — never an unlimited allowance.
3. **Dry run.** The exact trade is simulated before the wallet is asked to sign, so a trade that would fail says why.
4. **Trade.** One transaction; the wallet receives the output directly from the pool.

What a coin page shows

Market

- Price and change since launch / 24 h
- Market cap and real pair-token liquidity
- 24 h volume and trade count
- How much of the 920 M pool supply has been sold

History

- Price chart (1H / 24H / 7D / All) from every swap
- Trades with the real wallet behind each one
- Holders, with the pool, creator and treasury tagged
- Dexscreener chart when the pool is indexed

No backend, by design

The site has no database of trades and no indexer server. Prices come from the pool's state via the PoolManager's `extsLoad` (the same method Uniswap's own `StateLibrary` uses); trades come from the PoolManager's `Swap` events for that pool; holders are rebuilt from the coin's `Transfer` events. History is cached in the visitor's browser so return visits only read new blocks.

The practical consequence: **anyone can verify every number**. If the site went away tomorrow, every coin, pool and balance would still be on Arc, tradable through any interface that speaks Uniswap v4.

Deep links

Each coin page has a permanent link — `/arc#coin/<contract address>` — that can be shared or bookmarked. After a launch, the site opens the new coin's page automatically.

SECTION 5

IN PROGRESS

5 CirclePad — launch together

"One project. Everyone's USDC. Nobody's rug." CirclePad is built for launches that are bigger than one person: a community pools USDC first, and the project launches with that money already behind it.

Why raise before launching

On an instant launchpad the first price is set by whoever is fastest. On CirclePad, the first price is set by everyone who contributed during the raise — and most of what they contributed is designed to become real pool liquidity the moment the project launches. There is no empty curve to snipe and no race at block one.

One project at a time

CirclePad runs a single round at a time, so attention, liquidity and contributors are concentrated on one project rather than spread across hundreds.

A fixed 72-hour window

Every raise lasts exactly three days, enforced by the contract's deadline. When the window closes, it closes — no extensions, no quiet reopening.

Always withdrawable while open

Contributors can take their own USDC back at any moment before the deadline. There is no lock-in until the raise actually closes.

Everyone gets a say

In the full design, every contributor — not only the biggest — votes on the project's name, ticker, logo, roadmap and launch date, weighted by their share.

Where CirclePad is today

The first-round escrow contract (**BigPadEscrow**) is deployed on Arc mainnet. It is deliberately simple: the recipient wallet starts a 72-hour timer; anyone can contribute native USDC while it runs and withdraw their own contribution before it closes; when it closes, the balance is split automatically between the recipient, the platform and the treasury. The escrow has been deployed but **not yet started** — no funds are at risk until a round is announced and opened.

A companion voting contract (**BigPadVote**) lets contributors vote on options published by the recipient during the round. It is deployed once a round starts, because it reads the round's deadline.

The larger mechanism — competitive leadership, the 12-hour checkpoint, vesting and clawback — is a separate contract still in design. It will not hold real funds before an independent security review (Section 10).

SECTION 5.2

A round, step by step

A CirclePad round has five stages. The first round implements the raise and the automatic split; the later stages describe the full design.

Figure 4 — The 72-hour raise is live in the first-round escrow; checkpoint, LP creation and vesting belong to CirclePad v2.

1 · The raise ROUND 1

The recipient wallet calls `start()`, which sets a deadline exactly 72 hours ahead. Anyone can contribute USDC; each contribution is recorded against the contributor's address. A live leaderboard ranks contributors by amount and share.

2 · Governance ROUND 1

While the raise runs, contributors vote on the options published for the round. Votes are weighted by each wallet's share of the raise, so influence follows commitment — but every contributor has a voice, not just the largest.

3 · Close and split ROUND 1

When the deadline passes, contributions stop and withdrawals end. In the first round, the escrow splits the balance directly: **80% to the recipient** (for the project's launch liquidity), **5% to the platform** and **15% to the treasury**.

4 · Launch V2

In the full design, 80% of the raise becomes real liquidity in the project's pool immediately, so the coin opens with deep liquidity instead of an empty curve. Dexscreener listing and promotion are paid by the platform, not by the lead.

5 · Grow together V2

The lead's 15% is released gradually — 3% per day over five days — while CirclePad's 5% funds buybacks and promotion for the ecosystem.

SECTION 5.3

PLANNED

CirclePad v2: leads, votes and vesting

The full CirclePad design answers one question: how can a community fund a project lead without handing a stranger a lump sum?

Leadership is earned by commitment

The largest contributor to a raise becomes the project's lead. Putting the most money in is the clearest signal of commitment — and the lead's own contribution is at stake alongside everyone else's.

The 12-hour checkpoint

When the raise ends, the confirmed lead has 12 hours to publish the project's confirmed details, an official X account, and at least one community channel (an X Community, Telegram or Discord; a website is encouraged). If they miss the checkpoint, leadership passes to the second-largest contributor, who gets the same 12 hours.

Vesting instead of a lump sum

An earlier draft paid the lead's 15% the moment the checklist was met. That was too easy to exploit: someone could self-fund a majority bid, clear the checklist in minutes and leave with a share of everyone else's money. In v2 the lead's share **vests at 3% per day over five days**.

Automatic clawback

Vesting alone doesn't stop a lead from collecting a few days and disappearing. So the lead must check in on-chain periodically — roughly every 48 hours. A missed check-in marks the project abandoned **automatically** — no admin, no vote, no judgment call — and everything not yet vested returns to the original contributors, pro rata to what they put in.

SHARE OF A RAISE	ROUND 1 (LIVE)	V2 (PLANNED)
Largest part	80% to the recipient	80% into pool liquidity at launch
Project lead	—	15%, vested 3%/day, clawback if abandoned
Platform	5%	5% — buybacks and promotion
Treasury	15%	—
Refunds	Any time before the deadline	Any time before the deadline

Holder benefits

- **Real liquidity from block one** — participants join a project that launches with a pool, not a race against bots on an empty curve.
- **ArcPad synergy** **PLANNED** — existing ArcPad participants are planned to get an advantage when a CirclePad round opens.
- **CirclePad airdrop** **PLANNED** — a separate airdrop for CirclePad participants is planned. Eligibility, size and timing will be published before anything goes live.

SECTION 6 |

6 \$ARCIRCLE — the core coin

Relaunched on Argus

\$ARCIRCLE was relaunched on Argus on 25 September 2026 (contract 0xe5718F298ac3b65FAf7c711b56cBD72b3bb15fF7) and trades in a Uniswap v4 pool paired with USDC. The first launch on foci's bonding curve is kept as a record in Appendix A.

ArcPad and CirclePad are two different ways to launch. \$ARCIRCLE is the one coin that sits between them — the place where the ecosystem's growth is meant to come back together.

Identity

What it is

A community memecoin on Arc, relaunched publicly on Argus on 25 September 2026. It has no team allocation, no vesting schedule and no special permissions — it is a plain ERC-20 that trades in a public Uniswap v4 pool.

What it is for

It is the asset ARCIRCLE PAD's flywheel points at. Launch fees, platform allocations, trading fees and raise shares are designed to flow back into \$ARCIRCLE through buybacks, liquidity support and rewards.

Why a memecoin, and why this one

Launchpads live on attention, and attention gathers around symbols. A launch ecosystem needs one coin that everyone in it recognises and has a reason to hold: the thing the community rallies behind when a new launch goes well, and the thing that benefits from every launch that happens.

\$ARCIRCLE fills that role without asking anyone to trust an insider allocation. Because its supply went straight into a public market, every holder — including the project's own treasury — acquires \$ARCIRCLE the same way: by buying it at the market price.

Where to get it

1. On **Argus** (argus.world), where it was relaunched — trades settle in its Uniswap v4 pool, in your own wallet.
2. On **ArcPad's \$ARCIRCLE page** ([/arc#arcircle](https://arc#arcircle)), which shows the live price, chart, recent trades, holders and buybacks read straight from the pool, and links to Argus to trade.

Check the contract, every time

The official \$ARCIRCLE contract is 0xe5718F298ac3b65FAf7c711b56cBD72b3bb15fF7. A different token called "ARCcircle" already has a Dexscreener pair on Arc. ARCIRCLE PAD's pages only ever match \$ARCIRCLE by its contract address — never by name or ticker.

SECTION 6.2

How \$ARCIRCLE trades

\$ARCIRCLE trades on **Argus**, a permissionless launchpad on Arc built on Uniswap v4 hooks. There is no virtual curve and no graduation step: the whole supply went into one real Uniswap v4 liquidity position at launch, and that position is locked for good.

Launchpad	Argus (argus.world) — launched 25 September 2026, 14:09 UTC
Pool	Uniswap v4 · \$ARCIRCLE / USDC · 1% pool fee · tick spacing 200
Pool ID	0xfd282cf8bbc57813724e7c6cb1bda6bdf5d2caf02b3bce60cc6aac38ed26ebba
PoolManager	0x8366a39CC670B4001A1121B8F6A443A643e40951 (shared by every v4 pool on Arc)
Liquidity	Held by the launch's own Locker contract, which has no withdraw function — nobody, Argus included, can pull it

Trading costs

Every swap pays the 1% pool fee plus the launch's buy or sell tax, which is set once at launch (1–10% per side) and fixed for the life of the pool. The tax is taken on the USDC side of the trade. Wallet-to-wallet transfers pay nothing.

Where the tax goes

10% to Argus

The launchpad's share of every tax it collects, sent to the Argus treasury.

90% to the creator's allocation

Split at launch between creator funds, buyback & burn, holder dividends and liquidity, paid in USDC. For \$ARCIRCLE it is one of the flywheel's revenue sources (Section 7).

Bonding milestone

Argus marks a launch as bonded once its price crosses a threshold set at launch. It is a milestone only: the pool does not move, liquidity stays in the same locked position and trading never pauses. ArcPad's \$ARCIRCLE page shows the progress live.

Check the pool, not the name

ARCIRCLE PAD reads \$ARCIRCLE's price, trades and liquidity from this exact pool ID on the PoolManager. A pool with a different ID is not the official market.

SECTION 6.3

Supply, burn and circulation

At launch Argus minted the entire supply once and placed all of it in the pool's liquidity position, above the opening price; buyers take tokens out of that position as they buy. No wallet received a pre-mint and there is no team allocation.

1,000,000,000

total supply, fixed, 18 decimals

116,772,290.56

burned — 11.68% of the supply

883,227,709

circulating after the burn

The burn

On 25 September 2026, 116,772,290.56 \$ARCIRCLE — 11.68% of the total supply — was sent to the dead address `0x00000000000000000000000000000000dEaD` (transaction `0x0c90...99ae`). No one holds a key to that address, so those tokens can never move again. The live total, including any future burn, is on arcircle.app/arcircle.

Reading the numbers

- **Market cap** on ARCIRCLE PAD and on Dexscreener is price × 1,000,000,000 (total supply).
- **Circulating supply** is the total supply minus the burned tokens.
- **Holders and the supply split** leave out the pool, the dead address and Argus's own contracts, so they count real wallets only.

First launch

\$ARCIRCLE first launched on foci's bonding curve on 22 September 2026. That launch was retired; its curve mechanics and distribution are kept as a record in Appendix A.

SECTION 6.4

What \$ARCIRCLE is for

\$ARCIRCLE has no protocol-level powers — it can't mint, vote on contracts or unlock features by itself. Its utility comes from the roles the ecosystem gives it, some live today and some planned.

ROLE	WHAT IT MEANS	STATUS
Core coin	The coin that represents ARCIRCLE PAD as a whole: featured on ArcPad's Home and Explore, with its own full trading page.	LIVE
Pair token	Creators can launch ArcPad coins paired with \$ARCIRCLE, so buying those coins requires \$ARCIRCLE and their pools hold it as liquidity.	LIVE
Flywheel target	Platform revenue is designed to buy back \$ARCIRCLE and support its liquidity.	SOON
Holder rewards	A reward program for \$ARCIRCLE holders, funded by ecosystem revenue.	PLANNED
Creator rewards	Rewards for creators who launch on ArcPad or raise on CirclePad and bring real activity — with a likely emphasis on \$ARCIRCLE-paired launches.	PLANNED
Community voice	Signalling on ecosystem parameters (reward splits, featured launches) weighted by \$ARCIRCLE held.	PLANNED

The \$ARCIRCLE pair, in practice

When a coin is launched paired with \$ARCIRCLE, three things happen that don't happen with a USDC pair:

1. **Demand.** Every buyer of the new coin needs \$ARCIRCLE first — either buying it or already holding it.
2. **Liquidity.** The new coin's pool accumulates real \$ARCIRCLE as it grows, taking that \$ARCIRCLE out of circulation for as long as the pool holds it.
3. **Fees in \$ARCIRCLE.** The sell-side fees of that coin are paid in \$ARCIRCLE, so its creator and the platform earn the core coin directly.

The more launches pair with \$ARCIRCLE, the more of the ecosystem's everyday activity runs through it — without any change to \$ARCIRCLE's own contract.

What \$ARCIRCLE is not

It is not a share, a claim on revenue, or a security. Holding it gives no legal right to any payment. Buybacks and rewards are intentions of the project, funded from revenue when and if there is revenue, on terms that will be published before they start.

SECTION 7 |

7 The flywheel

Every launch turns the wheel. The wheel turns for \$ARCIRCLE.

Figure 5 — The loop: launches create revenue, revenue supports \$ARCIRCLE, a stronger \$ARCIRCLE draws more launches.

1 · Launch

Creators launch coins on ArcPad and raise together on CirclePad. Every launch brings new people and new volume to Arc.

2 · Earn

Launch fees, ArcPad's platform allocation and trading-fee share, CirclePad's raise share and the creator's share of \$ARCIRCLE's trading fee flow in.

3 · Buy back

That revenue goes back into \$ARCIRCLE — buybacks and liquidity support that work for its value.

4 · Grow

A stronger \$ARCIRCLE funds holder and creator rewards and draws in more creators, so the next round of launches is bigger.

The flywheel does not rely on new token emissions. \$ARCIRCLE's supply is fixed; everything that feeds the loop comes from real use of the ecosystem — people launching, trading and raising.

An illustration, not a forecast

To show how the pieces add up, imagine a month in which 100 coins launch on ArcPad and trade a combined \$500,000 of volume, one CirclePad round raises \$50,000, and \$ARCIRCLE itself trades \$100,000 on its curve:

SOURCE	CALCULATION	REVENUE
Launch fees	$100 \times 1 \text{ USDC}$	\$100
ArcPad fee share	$0.3\% \times \$500,000$	\$1,500
CirclePad raise share	$5\% \times \$50,000$	\$2,500
\$ARCIRCLE creator fee (example: 2%)	$2\% \times \$100,000$	\$2,000
Total, before allocations	plus 8% of each launched coin's supply	\$6,100

These figures are hypothetical, chosen only to show the arithmetic. Actual activity may be far lower or higher.

SECTION 7.2

Revenue in, value out

Where revenue comes from

SOURCE	PRODUCT	SIZE	PAID IN
Launch fee	ArcPad	1 USDC per launch	USDC
Platform allocation	ArcPad	8% of every coin's supply	The launched coin
Trading-fee share	ArcPad	30% of the 1% base fee on every trade	Coin (buys) · pair token (sells)
Raise share	CirclePad	5% of each raise at close	USDC
Creator fee	\$ARCIRCLE	90% of the Argus buy / sell tax on every \$ARCIRCLE trade (the creator's allocation)	USDC

Where it is meant to go

Buybacks

Buying \$ARCIRCLE on the open market — on the curve before graduation, in the DEX pool after.

Liquidity support

Adding depth to \$ARCIRCLE's market after graduation so trades move the price less.

Rewards SOON

Funding the holder and creator reward programs described in Section 8.

Commitments

- 1. Publish before acting.** The exact split between buybacks, liquidity and rewards will be published on the \$ARCIRCLE page before any of it goes live.
- 2. Known wallets.** Treasury and platform wallets are public (Section 9). Anyone can follow what comes in and what goes out on ArcScan.
- 3. Report the results.** Buybacks will be posted with their transaction links so the community can verify amounts and timing.
- 4. No surprise supply.** \$ARCIRCLE's supply is fixed at one billion. The flywheel never mints new \$ARCIRCLE.

Handling launched-coin allocations

The 8% allocation from each ArcPad launch is paid in that launch's own coin, which may be illiquid. The treasury will manage these allocations case by case — holding, supporting the coin's liquidity, or converting gradually when a coin has a real market — with the principle that the treasury should never be the reason a small community coin crashes. The approach will be documented alongside the revenue split.

Honest limits

Revenue depends on usage. In quiet periods the flywheel turns slowly, and buybacks cannot guarantee any price. The flywheel describes how revenue is intended to be used, not a promise about \$ARCIRCLE's value.

SECTION 8

COMING SOON

8 Rewards for holders and creators

The reward system is how the flywheel gives back to the people who grow ARCIRCLE PAD — the ones who hold \$ARCIRCLE and the ones who launch. It is being designed now and is not live.

Holder rewards

For \$ARCIRCLE holders, funded by what ArcPad and CirclePad earn. The aim is to reward holding through time, not just a balance on one day.

Creator rewards

For creators who launch on ArcPad or raise on CirclePad and bring real activity to Arc — measured by genuine trading and holders, not by launch count.

Design principles

- 1. Funded by revenue, never by emissions.** Rewards come out of real ecosystem income. No new \$ARCIRCLE is created to pay them.
- 2. Hard to farm.** Snapshots taken at unannounced times, minimum holding periods, and activity measured over windows make it expensive to game the program with short-term balances or wash trading.
- 3. Verifiable.** Eligibility rules are published, and results can be recomputed by anyone from public chain data.
- 4. Simple to claim.** One place to see eligibility and claim, on the ARCIRCLE PAD site.

What the next update will define

QUESTION	TO BE PUBLISHED
Who qualifies	Holder thresholds and holding periods; creator activity criteria
How it's funded	The share of revenue set aside for each program, visible on-chain
How it's paid	Asset (USDC, \$ARCIRCLE or both), cadence and claim window
Where to claim	The Reward section of the site (today a "coming soon" panel)

Candidate mechanics under study

- **Time-weighted holder snapshots** — average balance over an epoch rather than a single-block balance.
- **Creator score** — combining a coin's organic volume, unique buyers and holder retention, with a boost for \$ARCIRCLE-paired launches.
- **Referral share** — a slice of fees for wallets and communities that bring in launches, once referral support is added to the routers.

Everything on this page is design intent. The final program may differ, and it will only go live once its rules are published on the site.

SECTION 9 |

9 Architecture and contracts

ARCIRCLE PAD is a set of contracts on Arc mainnet and a static website that talks to them. There is no server holding user funds or data.

CONTRACT	ADDRESS (ARC MAINNET)
\$ARCIRCLE token	0xe5718F298ac3b65FAf7c711b56cBD72b3bb15fF7
\$ARCIRCLE pool (Uniswap v4, pool ID)	0xfd282cf8bbc57813724e7c6cb1bda6bdf5d2caf02b3bce60cc6aac38ed26ebba
ArcPad factory (HomepadFactoryArc)	0x0ebd6df354056ff469F17F8Fd14dc0D2c87bd65E
ArcPad fee hook (HomepadHybridHook)	0x484D416E73Eb44d276DDeF04cDBAdf2f4907c044
ArcPad router (HomepadArcSwapRouter)	0xFCA8fD788d44Bb335B1451257366e06D67114785
CirclePad escrow (BigPadEscrow)	0xC5998d7cE728FDd6f77217fdE775aAb90Ec61703
Platform treasury	0xa066e6C5D1ac561A4065B9D6B00feF89C0bD02F8
Uniswap v4 PoolManager	0x8366a39CC670B4001A1121B8F6A443A643e40951
USDC (ERC-20 interface, 6 dp)	0x3600000000000000000000000000000000000000
Multicall3	0xcA11bde05977b3631167028862bE2a173976CA11

How the pieces fit

- **Factory** — creates each coin, collects the launch fee, sends the 8% allocation, initialises the Uniswap v4 pool, adds the single-sided liquidity, registers the fee hook and records the launch metadata. It also executes optional dev buys.
- **Hook** — runs after every swap in an ArcPad pool, takes the fee from the output and pays the creator and platform immediately. It only acts on pools the factory registered.
- **Router** — the buy/sell entry point for users: pulls the input, swaps through the PoolManager, enforces the minimum output and returns any unspent input.
- **Escrow** — holds CirclePad contributions, enforces the 72-hour deadline, refunds on request while open and splits the balance at close.

The website

The site at arcircle.app is static HTML and JavaScript. It reads the chain through Arc's public RPC, connects wallets through Reown AppKit / WalletConnect or an injected wallet, and sends transactions only when the user signs them. Before any transaction it switches the wallet to Arc if needed, and it dry-runs launches and trades so failures are explained before signing.

SECTION 10

10 Security and transparency

The safest money is money a website never touches. ARCIRCLE PAD is built so that users sign every transaction themselves and every rule is enforced by contracts anyone can read.

Safeguards in place

Exact approvals

The site approves exactly the amount being traded or dev-bought, never an unlimited allowance.

Slippage floors

Every trade carries a minimum output; price moves beyond it revert the trade instead of filling badly.

Dry runs

Launches and trades are simulated before signing, with plain-language reasons when they would fail.

Chain checks

The wallet is switched to Arc before any write, so nothing is ever sent on the wrong network.

Address-only identity

Coins are identified by contract address, never by name — defeating look-alike tokens.

Sanitised metadata

Names, symbols and logos from arbitrary contracts are cleaned before display, so a malicious token can't inject content into the page.

Contract review status

COMPONENT	STATUS
ArcPad factory, hook, router	Deployed on mainnet; the launch flow has been exercised on-chain. Built on top of Uniswap v4 core. No third-party audit of the ArcPad contracts yet.
CirclePad first-round escrow	Deployed, not started. Deliberately minimal (deadline, contribute, refund, split).
CirclePad v2 (leads, vesting, clawback)	In design. Will not hold real funds before an independent security review.
\$ARCIRCLE curve	Operated by foci; source verified on ArcScan.

Known risks we design around

- **Hostile pair tokens** — fee-on-transfer, rebasing or freezable tokens can break a pool; the site warns on custom pairs and requires a known price.
- **Relay and wallet issues** — WalletConnect sessions are restored carefully and repaired automatically if storage gets out of sync, instead of forcing users to clear their cache.
- **Public RPC limits** — history is read in small, rate-limited chunks and cached locally.

Security findings can be reported privately to the team through the official channels listed on the site. Planned: a public bug-bounty scope once CirclePad v2 enters review.

SECTION 11

11 Community and governance

ARCIRCLE PAD starts with a small team making fast decisions, and moves toward the community deciding more as the system proves itself.

Today

Contract deployments, fee parameters, treasury management and the website are run by the core team. Many parameters are fixed in contracts and cannot be changed by anyone — ArcPad's fee cap, the 8% allocation, the fixed supply of every launch. Where the team does make choices (revenue splits, reward rules, featured launches), the commitment is to publish them before acting.

CirclePad: governance by contributors

CirclePad already puts decisions in contributors' hands. Every contributor to a round votes on the project's identity — name, ticker, logo, roadmap and launch date — weighted by their share of the raise. This is the first place real on-chain governance appears in the ecosystem.

Where it goes next PLANNED

AREA	DIRECTION
Revenue split	Community signalling, weighted by \$ARCIRCLE held over time, on the split between buybacks, liquidity and rewards.
Featured launches	Holders help choose which ArcPad coins and CirclePad rounds get featured.
New pair tokens	Community input on which tokens get one-tap presets in the launch form beyond USDC and \$ARCIRCLE.
Treasury reports	Regular public reports on treasury inflows, buybacks and allocations, with transaction links.

How to take part

- **Launch** a coin on ArcPad — and consider pairing it with \$ARCIRCLE.
- **Contribute** to CirclePad rounds and vote on what the project becomes.
- **Hold** \$ARCIRCLE — the coin the whole ecosystem points at.
- **Build** — every contract is public; wallets, bots and dashboards can integrate ArcPad pools directly through Uniswap v4.

The long-term goal is that the people who make ARCIRCLE PAD busy are the people who decide where it goes.

SECTION 12|

12 Roadmap

Five phases, from what is already live to where the ecosystem is headed. Dates are targets, not promises; items can move between phases as the project learns.

Phase 0 — Foundation Q3 2026 · DONE LIVE

- ✓ \$ARCIRCLE relaunched on Argus (25 Sep 2026), its whole supply in one locked Uniswap v4 position
- ✓ 11.68% of the \$ARCIRCLE supply (116,772,290.56) burned to the dead address
- ✓ ArcPad factory, fee hook and router deployed on Arc mainnet
- ✓ ARCIRCLE PAD website: ArcPad, CirclePad and \$ARCIRCLE hubs with wallet connect
- ✓ Fixed, fair starting point for every launch ($\approx$ \$4,350 market cap)
- ✓ First coin launched on ArcPad
- ✓ Full coin pages: on-chain chart, trades, holders, buy/sell; automatic redirect after launch
- ✓ \$ARCIRCLE trading page inside ArcPad, trading directly against the verified curve
- ✓ Pair tokens: USDC, \$ARCIRCLE or any priced Arc token
- ✓ CirclePad first-round escrow deployed on mainnet

Phase 1 — First rounds Q4 2026 IN PROGRESS

- ☐ Open the first CirclePad round: 72-hour USDC raise with a live leaderboard
- ☐ Deploy the round's voting contract and run the first contributor vote
- ☐ Publish the flywheel revenue split on the \$ARCIRCLE page
- ☐ First treasury buybacks of \$ARCIRCLE, posted with transaction links
- ☐ Launch analytics on ArcPad: top gainers, volume leaders, newest \$ARCIRCLE-paired coins
- ☐ Community channels and regular ecosystem updates

Phase 2 — Rewards Q4 2026 – Q1 2027 PLANNED

- ☐ Holder rewards v1 — time-weighted snapshots, funded by revenue
- ☐ Creator rewards v1 — based on organic volume, buyers and retention
- ☐ Rewards dashboard and claim page in the Reward section
- ☐ Referral support in the routers, with a fee share for referrers

Figure 6 — The five phases at a glance. Phase 0 is complete; Phase 1 is under way.

SECTION 12 · CONTINUED

Roadmap, continued

Phase 3 — CirclePad v2 Q1 – Q2 2027 PLANNED

- ☐ Lead selection by largest contribution, with the 12-hour checkpoint and fallback to the next contributor
- ☐ 80% of each raise into pool liquidity at launch
- ☐ Lead payout vesting at 3% per day, with on-chain check-ins and automatic clawback to contributors
- ☐ Independent security review before any real funds; public bug bounty
- ☐ ArcPad synergy for CirclePad rounds and the CirclePad participant airdrop

Phase 4 — Ecosystem 2027 AND BEYOND PLANNED

- ☐ More one-tap pair presets (for example other Circle stablecoins on Arc) chosen with community input
- ☐ Creator toolkit: post-launch profile editing, announcements, holder insights
- ☐ Public data API and SDK so wallets, bots and dashboards can build on ArcPad
- ☐ Community governance over revenue splits, featured launches and reward parameters
- ☐ Partnerships with projects building on Arc

How progress will be reported

- Each shipped item is announced with a link a user can try, or a contract a user can read.
- The roadmap page on the site is updated as items move, including items that are dropped or delayed, with the reason.
- Treasury and buyback activity is reported with on-chain transaction links.

What will not change

Fixed supply

\$ARCIRCLE stays at 1,000,000,000 tokens. No roadmap item mints more.

Contracts hold the money

New products follow the same rule: user funds sit in contracts with public rules, not with people.

Fair starts

Every ArcPad launch opens at the same fixed point, whatever it is paired with.

Publish first

Revenue splits, rewards and parameters are published before they go live.

Roadmap items after Phase 0 are plans. Timelines depend on security reviews, market conditions and community feedback, and may change.

SECTION 13|

13 Risk factors

Anyone using ARCIRCLE PAD or holding \$ARCIRCLE should understand the risks. This list is not exhaustive.

Market risk

\$ARCIRCLE and coins launched on ArcPad are speculative, highly volatile and can lose all of their value. Liquidity can be thin; large trades move prices significantly.

Smart-contract risk

Contracts can contain bugs. The ArcPad contracts have not had a third-party audit; CirclePad v2 is unreleased. The foci curve is operated by a third party.

Pair-token risk

Coins paired with tokens other than USDC inherit those tokens' risks, including price moves, transfer restrictions or contract changes.

Network risk

Arc is a young network. Outages, congestion, RPC limits, or changes to the network or to USDC's behaviour on it could affect every product described here.

Stablecoin risk

Arc uses USDC as its native currency. Events affecting USDC — de-pegs, freezes, regulatory actions — would affect gas, fees, pools and raises.

Impersonation risk

Look-alike tokens, websites and social accounts exist. Always verify the contract address and use the official site.

Execution risk

Planned features — rewards, buybacks, CirclePad v2 — may be delayed, changed or never delivered. Revenue may be too small to fund them meaningfully.

Regulatory risk

Laws on digital assets differ between countries and are changing. Some features may be restricted in some places, and users are responsible for their own compliance.

Your responsibility

- Keep your seed phrase private. ARCIRCLE PAD will never ask for it.
- Check every transaction in your wallet before signing it — amount, contract and network.
- Only pair with, buy or contribute to things you understand and trust.

REFERENCE

Glossary and links

Arc	Circle's EVM-compatible layer-1 blockchain, where USDC is the native currency used for gas.
Bonding curve	A contract that sells a token along a pricing formula; \$ARCIRCLE trades on foci's curve until graduation.
Graduation	The moment a curve has raised its threshold and moves its liquidity to a DEX pool.
Virtual reserve	A reserve that exists only in the price formula, setting a non-zero starting price without real money behind it.
Uniswap v4 hook	A contract a v4 pool calls around swaps; ArcPad's hook takes and pays out the trade fee.
Pair token	The token an ArcPad coin trades against: USDC by default, \$ARCIRCLE, or another Arc token.
Dev buy	A creator's own purchase executed inside the launch transaction.
Slippage	How far the price may move before a trade reverts instead of filling.
Flywheel	The loop by which ecosystem revenue supports \$ARCIRCLE and a stronger \$ARCIRCLE attracts more activity.
Clawback	In CirclePad v2, the automatic return of an absent lead's unvested share to contributors.

Every launch turns the wheel.

ArcPad for instant launches. CirclePad for launching together. \$ARCIRCLE at the centre of both.

APPENDIX A.1

The bonding curve

Appendix A — first launch record

\$ARCIRCLE first launched on foci's bonding curve on 22 September 2026. That launch was retired when \$ARCIRCLE relaunched on Argus (Section 6.2). These two pages are kept as a record and no longer describe how \$ARCIRCLE trades.

In its first launch, \$ARCIRCLE traded against foci's **FociBondingCurve** contract, priced in USDC.

How the price works

The curve is a constant-product market between the \$ARCIRCLE it still holds and a USDC reserve. The USDC side includes a **virtual ("phantom") reserve**, so the very first token already has a non-zero price — the same idea ArcPad uses with its virtual reserve. As people buy, real USDC accumulates on top of the phantom amount and the price rises; as they sell, it falls.

Q = USDC reserve (phantom + real, excluding fees awaiting payout)

T = \$ARCIRCLE held by the curve

Buy with q USDC: $\text{fee} = 1\% \cdot q$, $\text{tax} = 2\% \cdot q$, $\text{net} = q - \text{fee} - \text{tax}$
 $\text{tokens out} = \text{net} \cdot T / (Q + \text{net})$

Sell n tokens: $\text{gross} = n \cdot Q / (T + n)$
 $\text{USDC out} = \text{gross} - 1\% \text{ fee} - 2\% \text{ tax}$

These formulas were checked against real \$ARCIRCLE trades on mainnet and reproduce them to the last unit, which is why ArcPad's \$ARCIRCLE page can quote trades exactly before they are sent.

Costs per trade

1% foci fee

Charged by the foci platform on every buy and sell.

2% creator tax

Charged on every buy and sell and paid to \$ARCIRCLE's creator side. It is one of the flywheel's revenue sources (Section 7).

On a buy, both are taken from the USDC going in; on a sell, both are taken from the USDC coming out. The effective round-trip cost of buying and immediately selling is therefore about 6%, before price impact — one reason \$ARCIRCLE is better suited to holding than to rapid trading while on the curve.

Protection built into the curve

- **Slippage floors.** Buys and sells carry a minimum output. If the price moves past it before the trade lands, the trade reverts (`SlippageExceeded`) rather than filling at a worse price.
- **Partial fills at the top.** If a buy would take more than the curve has left to sell, it fills what it can and refunds the unused USDC in the same transaction.
- **Frozen at graduation.** Once the curve is graduating or graduated, it stops accepting trades so liquidity can move cleanly to the DEX pool.

ARCIRCLE PAD does not operate the foci curve. Its \$ARCIRCLE page calls the same public contract any foci user does; foci's own terms and fees apply.

APPENDIX A.2

Supply, distribution and graduation

All 1,000,000,000 \$ARCIRCLE were minted in a single transfer from the zero address to the bonding curve at launch. No wallet — including the project's — received tokens any other way.

Figure A1 — How the curve divides the supply, derived from the curve's own `sellableTokens()` and token-reserve reads at the time of writing.

Two parts of one supply

The curve divides the supply it holds into a **sellable** part, which buyers can take from the curve, and a **reserved** part, which the curve keeps back to seed the DEX pool when \$ARCIRCLE graduates. At the time of writing, the reads imply roughly 714 million sellable and 286 million reserved, of which about 41 million had been bought.

Graduation

The curve tracks the real USDC it has taken in. When that reaches the **graduation threshold** — about 11,130 USDC at the time of writing — the curve is marked ready to graduate and stops trading. The accumulated USDC and the reserved \$ARCIRCLE are then used to open a DEX pool, and \$ARCIRCLE trades there from then on.

After graduation

- ArcPad's \$ARCIRCLE page watches Dexscreener for a pair whose base token is *exactly* the \$ARCIRCLE contract. When one appears, the Dexscreener chart and link switch on automatically.
- ArcPad launches paired with \$ARCIRCLE keep working unchanged — their pools hold \$ARCIRCLE itself, wherever it trades.
- Treasury buybacks (Section 7) move to the DEX pool.

Graduation depends entirely on market demand. It may happen quickly, slowly, or not at all; no one can schedule it.
